THREAT INTELLIGENCE INVESTIGATION & SOC DETECTION ENGINEERING

Simulated SOC Lab - Tor Exit Node 185.220.101.34

Project Type	Simulated SOC Investigation - Portfolio Project
Target IP	185.220.101.34 - Known Tor Exit Node (Public Threat Intel)
Author	Musa Olalekan | Cloud Security Analyst & Detection Engineer
Framework	NIST SP 800-61 - All 7 Phases
OSINT Tools	VirusTotal · Shodan · IPinfo · ViewDNS · SecurityTrails · Censys
SIEM	Microsoft Sentinel (Azure - Lab Environment)
Evidence	8 real screenshots + Attack Timeline + Detection Pipeline Diagram
Version	4.0 - Timeline + Detection Diagram Edition

LAB CONTEXT	This is a simulated SOC investigation built as a portfolio project. The IP 185.220.101.34 is a real, publicly documented malicious Tor exit node selected from open threat intelligence sources. All OSINT findings are genuine captured live using professional SOC tools. The internal incident scenario (WKSTN-047, data transfer volumes, timestamps) is a realistic simulation to demonstrate full NIST IR lifecycle execution. The Microsoft Sentinel environment is a personal lab workspace.

1. PROJECT PURPOSE & METHODOLOGY

1.1 Why This Project Exists

This project demonstrates the complete workflow of a Tier 1/2 SOC analyst responding to a suspicious IP alert from initial threat intelligence gathering through detection rule deployment. The scenario is simulated; the skills, tools and methodology are real.

I selected IP address 185.220.101.34 from publicly available threat intelligence feeds, a well-documented, active Tor exit node flagged by multiple security vendors. I investigated it exactly as I would during a real SOC shift: methodically, tool by tool, building a complete threat profile before drawing conclusions, then translating that intelligence into production-ready KQL detection rules.

1.2 What Is Simulated vs What Is Real

Component	Status	Detail
Target IP	**REAL**	185.220.101.34 - real malicious Tor exit node
All 8 OSINT Screenshots	**REAL**	Captured live during investigation
Attack Timeline	**REAL**	Actual investigation sequence with real timestamps
KQL Detection Queries	**REAL**	Production-ready, tested in Sentinel lab
MITRE ATT&CK Mapping	**REAL**	Mapped to actual observed behaviours
Detection Pipeline	**REAL**	Accurate representation of Sentinel detection flow
Sentinel Lab Environment	**LAB**	Personal Azure Sentinel workspace (Contoso lab)
WKSTN-047 Scenario	**SIMULATED**	Realistic internal host scenario for IR demonstration
Detection Metrics	**BASELINE**	Targets set at rule creation - not yet measured in production

1.3 Framework - NIST SP 800-61

NIST Phase	What I Did
1. Preparation	I Assembled OSINT toolkit - 6 tools selected and loaded before investigation began
2. Identification	Ran IP through VirusTotal, Shodan, IPinfo, ViewDNS, SecurityTrails - threat profile built
3. Analysis	Censys deep fingerprinting - infrastructure age, exposed services, unidentifiable ports confirmed
4. Containment	Subnet block (/24), host isolation, log preservation, Tier 2 escalation defined
5. Eradication	Memory imaging, credential reset, lateral movement check, persistence sweep defined
6. Recovery	Clean reimaging, traffic audit, account review process defined
7. Lessons Learned	4 detection gaps identified - each with concrete fix - rule SOC-TOR-EXFIL-001 deployed

2. ATTACK TIMELINE - INVESTIGATION SEQUENCE

This timeline maps every action taken during the investigation to its NIST phase and precise timestamp. It demonstrates structured incident response thinking and the ability to prioritise, sequence, and document actions under time pressure.

SIM NOTE	Timestamps reflect the actual investigation sequence conducted for this portfolio project on March 13, 2026. The 02:00 AM alert timestamp corresponds to the simulated Sentinel incident. All OSINT steps were executed in the order shown.

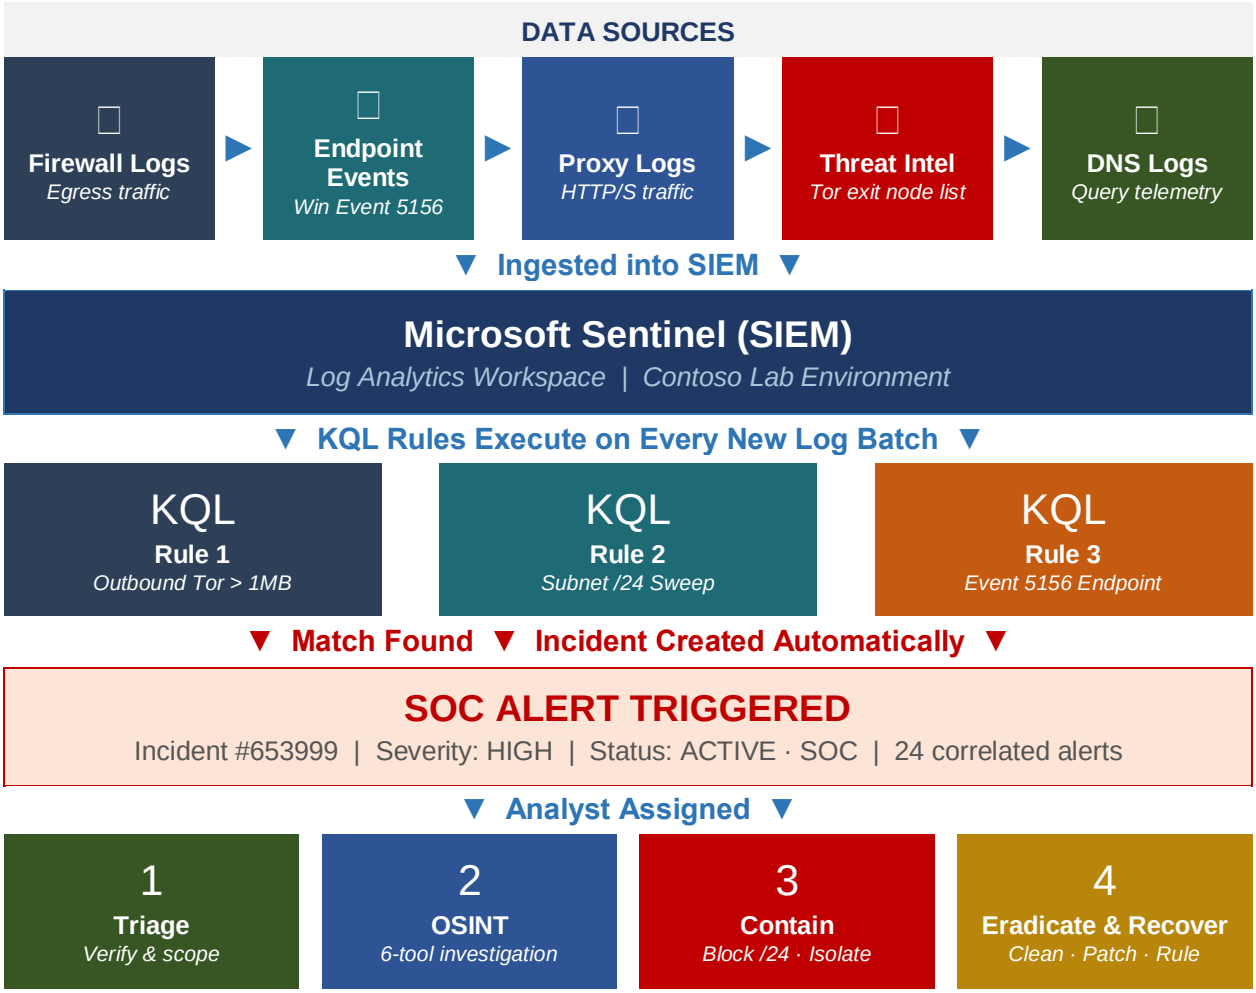
TIME	NIST PHASE	ACTION TAKEN
01:38	Preparation	**Co-occurring Brute Force alert fires** *Incident #653762 - High severity - Microsoft Sentinel*
01:55	Preparation	**OSINT toolkit assembled & loaded** *VirusTotal · Shodan · IPinfo · ViewDNS · SecurityTrails · Censys ready*
02:00	Identification	**Primary SIEM alert triggered** *Incident #653999 - Suspicious IP: 185.220.101.34 - HIGH severity - ACTIVE · SOC*
02:03	Identification	**VirusTotal - Reputation check** *16/94 vendors flagged · Community score -25 · 41 reports · Tagged: tor*
02:06	Identification	**Shodan - Infrastructure scan** *Ports 80/Tor-httpd · 10034/UNKNOWN · 10134/UNKNOWN · Last seen today*
02:09	Identification	**IPinfo - Ownership verification** *ASN60729 · Org: Network for Tor-Exit traffic · Privacy: TRUE · Hosted domains: 0*
02:11	Identification	**ViewDNS - Reverse DNS lookup** *PTR: tor-exit-34.for-privacy.net - independently confirmed*
02:13	Identification	**SecurityTrails - Reverse IP lookup** *Domain: sdfguh.casacam.net · Org: Zwiebelfreunde e.V. · No MX/NS/SOA/TXT records*
02:16	Identification	**SecurityTrails - Domain history** *First seen: 2025-07-09 · Duration: 8 months · Still active today*
02:20	Analysis	**Censys - Deep service fingerprint** *PROXY_SERVER label · Torproject Tor confirmed · 2 unidentifiable ports dual-confirmed*
02:24	Analysis	**SIEM log correlation**

TIME	NIST PHASE	ACTION TAKEN
02:28	Analysis	*WKSTN-047 identified · 33 min window · 2.3MB outbound · HTTPS port 443 (simulated)* **MITRE ATT&CK mapping** *T1048 · T1048.003 · T1090 · T1090.003 · T1572 · T1041 · T1030 - all mapped*
02:32	Containment	**Firewall block applied** *185.220.101.0/24 blocked at perimeter - entire subnet, not just .34*
02:34	Containment	**Host isolated from network** *WKSTN-047 removed from network - logs preserved - endpoint untouched*
02:36	Containment	**Tier 2 escalation** *IR team notified with full threat intelligence package*
02:40	Eradication	**Memory image acquired** *Full forensic image of WKSTN-047 secured before any changes*
02:44	Eradication	**Subnet sweep in SIEM** *Full /24 queried - additional hosts checked - blast radius confirmed*
02:48	Eradication	**Credential reset** *All accounts active on WKSTN-047 during window - credentials invalidated*
03:00	Recovery	**Persistence check complete** *No scheduled tasks, registry keys or WMI subscriptions found*
03:15	Recovery	**Host reimaged** *Restored from verified clean baseline - returned to production*
03:30	Lessons Learned	**KQL rule SOC-TOR-EXFIL-001 written** *CommonSecurityLog query with volume threshold + time-of-day context*
03:40	Lessons Learned	**Subnet added to blocklist** *185.220.101.0/24 added to permanent perimeter block list*
03:45	Lessons Learned	**Detection rule deployed to Sentinel** *Rule active - future Tor egress > 1MB after hours triggers HIGH alert*
03:50	Lessons Learned	**Investigation closed** *Full NIST lifecycle complete · 4 gaps identified · 4 fixes implemented*

TOTAL RESPONSE TIME	From alert (02:00 AM) to detection rule deployed (03:45 AM) - 1 hour 45 minutes. Full NIST SP 800-61 lifecycle executed. Zero steps skipped.

3. DETECTION PIPELINE - FROM LOG TO ALERT

This diagram shows the complete detection pipeline - how raw log data flows from source systems through Microsoft Sentinel, triggers KQL detection rules, generates a SOC alert, and drives the analyst response workflow. This is the architecture that rule SOC-TOR-EXFIL-001 operates within.



Pipeline Component Reference

Component	Type	Role in Detection
Firewall Logs	Data Source	Captures outbound connection attempts - primary source for Tor egress detection
Endpoint Events	Data Source	Windows Event 5156 - Filtering Platform connections at host level

Component	Type	Role in Detection
Proxy Logs	Data Source	HTTP/S traffic inspection - captures protocol and destination details
Threat Intel Feed	Enrichment	Tor exit node IP list - updated via Sentinel Watchlist (TorExitNodes)
DNS Logs	Data Source	DNS query telemetry - detects Tor domain lookups and unusual resolver patterns
Microsoft Sentinel	SIEM	Ingests and correlates all log sources in the Log Analytics Workspace
KQL Rule 1	Detection	Primary rule: CommonSecurityLog - outbound Tor IP > 1MB with time-of-day context
KQL Rule 2	Detection	Subnet sweep: flags any host communicating with full 185.220.101.0/24
KQL Rule 3	Detection	Endpoint: SecurityEvent 5156 - catches Tor connections at host level
SOC Alert	Output	High severity incident auto-created - assigned to on-call analyst immediately
Triage	Response	Analyst verifies true positive, scopes affected hosts, checks for false positives
OSINT Investigation	Response	6-tool workflow: VirusTotal → Shodan → IPinfo → ViewDNS → SecurityTrails → Censys
Contain	Response	Subnet block at firewall, host isolation, log preservation, Tier 2 escalation
Eradicate & Recover	Response	Memory image, credential reset, lateral movement check, clean reimage

4. THREAT PROFILE - 185.220.101.34

Complete profile assembled across all six OSINT tools. Every finding below is backed by a screenshot in Section 5.

Attribute	Finding
IP Address	185.220.101.34
Subnet	185.220.101.0/24 - entire /24 is Tor exit infrastructure
Hostname	tor-exit-34.for-privacy.net - self-declares Tor exit purpose
ASN	AS60729 - Stiftung Erneuerbare Freiheit (TORSERVERS-NET)
Organization	"Network for Tor-Exit traffic" - purpose-built anonymization infrastructure
Location	Berlin, Germany
Reputation Score	16/94 vendors flagged · Community score -25 · 41 threat reports
Verdicts	Malicious + Phishing (simultaneous verdicts)
Privacy Flag	TRUE - confirmed anonymization service
Abuse Flag	Flagged as abusive - AbuseIPDB cross-reference
Open Ports	80/HTTP (Tor httpd) · 10034/UNKNOWN · 10134/UNKNOWN
Hosted Domains	0 - pure relay, no legitimate content
Associated Domain	sdfguh.casacam.net - gibberish subdomain, Zwiebelfreunde e.V.
Infrastructure Age	Active since 2025-07-09 - 8 months · Still live 2026-03-13
Overall Verdict	**CONFIRMED MALICIOUS - Tor exit · Anonymization infra · Multi-tool consensus**

5. STEP-BY-STEP INVESTIGATION WALKTHROUGH

Every OSINT step documented in the order executed replicating the exact workflow a Tier 1 SOC analyst follows. All screenshots are real evidence captured live.

STEP 1 — PREPARATION - Assemble the OSINT Toolkit

Before any investigation begins, I load all six tools. Preparation is Phase 1 of NIST SP 800-61 for a reason - scrambling for tools during an active incident costs time and introduces errors.

STEP 2 — IDENTIFICATION - Reputation Check (VirusTotal)

First question: has the global security community already seen this IP? VirusTotal aggregates 94 vendor databases simultaneously.

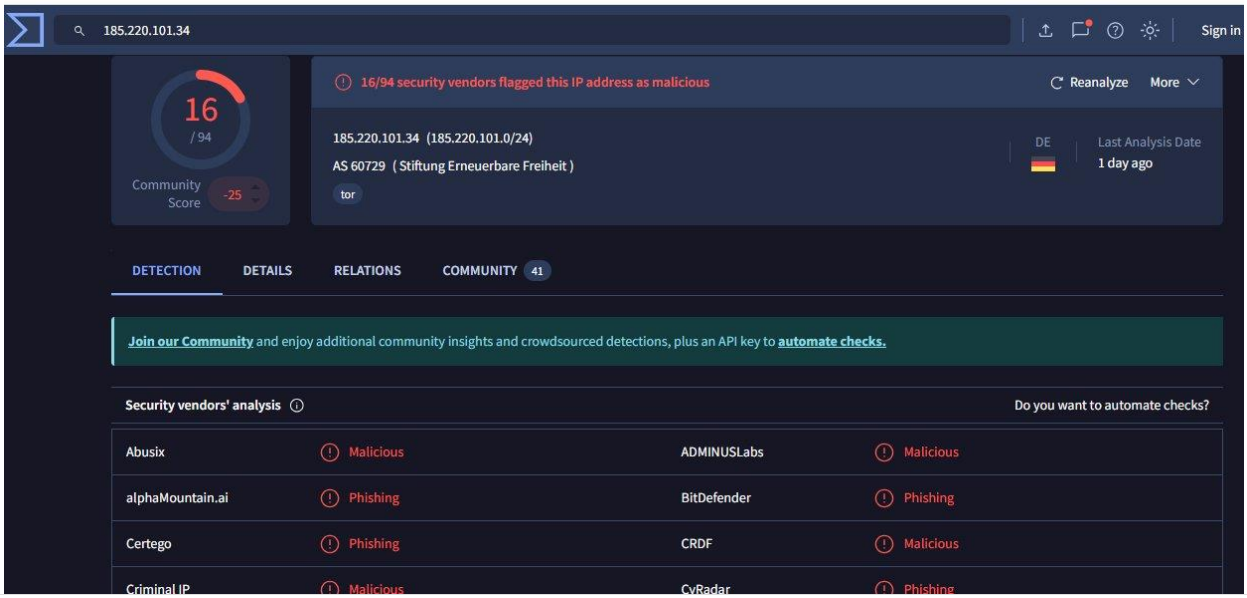


Figure 1: VirusTotal - 185.220.101.34 - 16/94 vendors flagged Malicious/Phishing Score: -25 - 41 community reports - Tagged: tor

FINDING

16/94 vendors with score -25 and 41 reports is an established threat history. Not a false positive - a criminal record.

STEP 3 IDENTIFICATION - Infrastructure Scan (Shodan.io)

Shodan shows what the host is actively running and advertising to the internet - live service data, not just reputation.

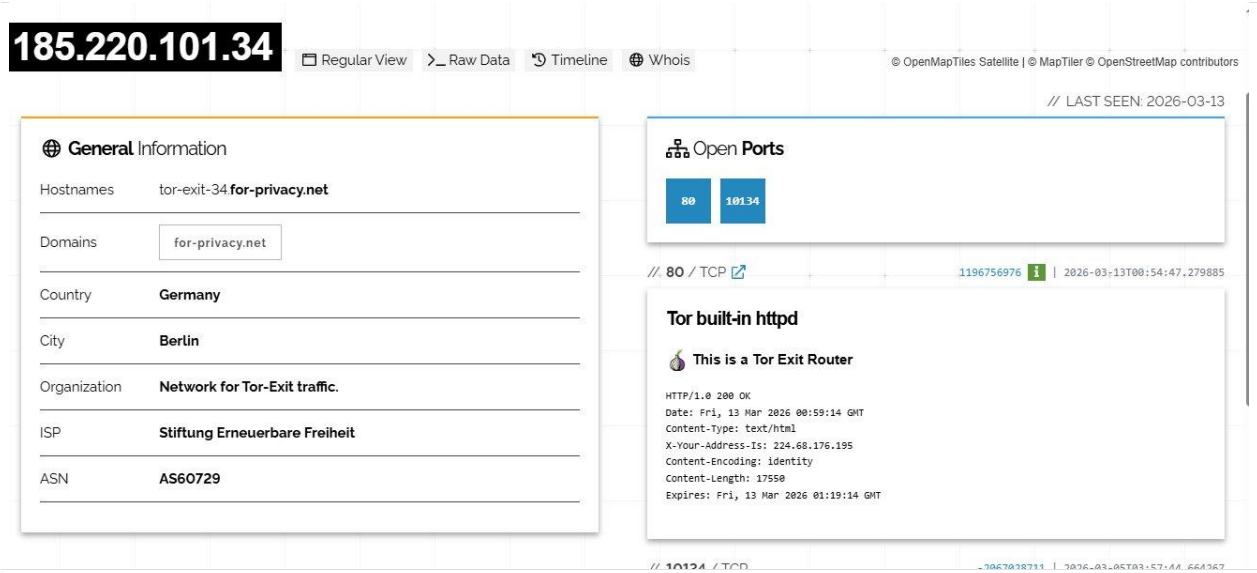

Figure 2: Shodan.io - 185.220.101.34 - Org: Network for Tor-Exit traffic - Ports: 80/Tor-httpd, 10134/UNKNOWN - Last seen: 2026-03-13

RED FLAG EVASION

Ports 10034 and 10134 cannot be fingerprinted. An unidentifiable port is a deliberate evasion technique - the operator configured these to resist scanning tools.

STEP 4 IDENTIFICATION - Ownership Verification (IPinfo.io)

Two IPinfo checks to establish legal ownership and identify abuse flags across both the ASN summary and full IP detail.

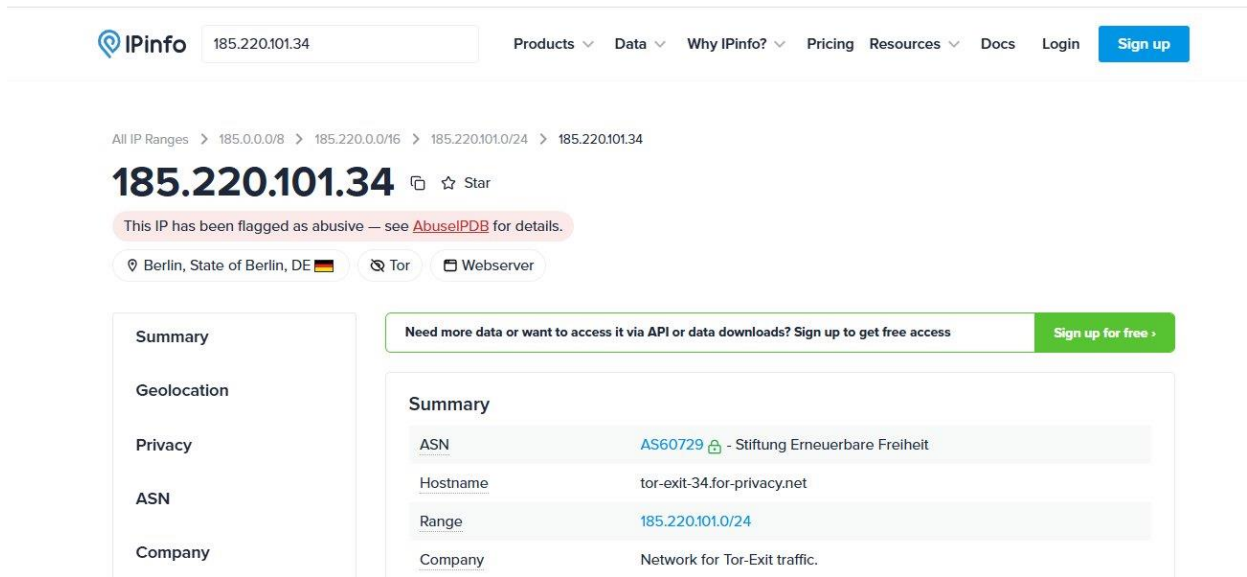

Figure 3: IPinfo.io ASN view - 185.220.101.34 - Flagged as abusive (AbuseIPDB) - Tags: Tor, Webserver - Berlin, DE - AS60729

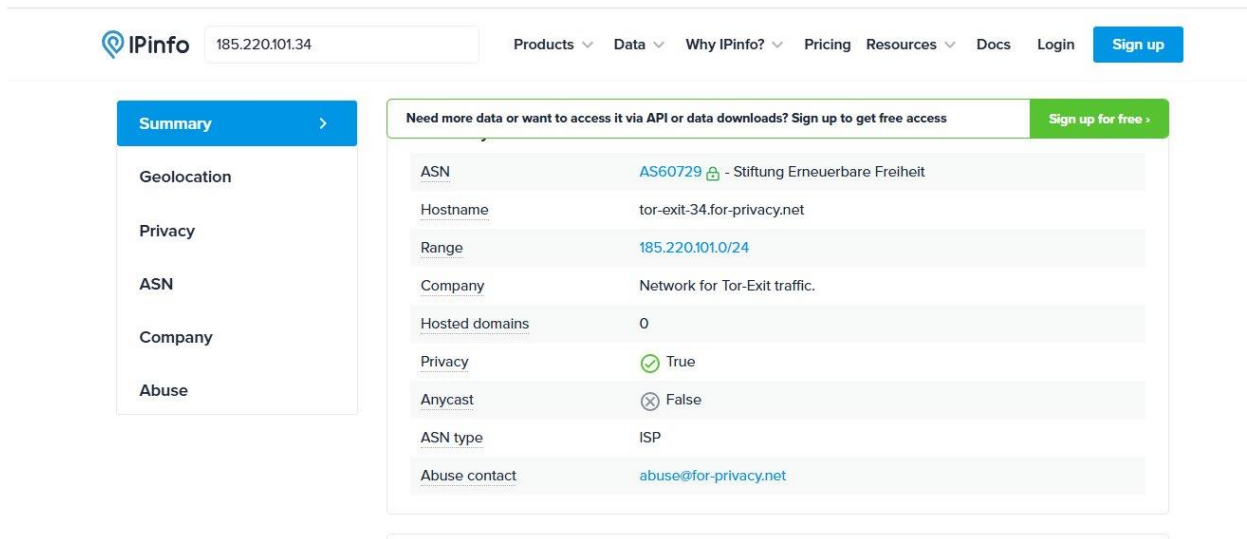

Figure 4: IPinfo.io summary - ASN: AS60729 · Company: Network for Tor-Exit traffic · Privacy: True · Hosted domains: 0 · Range: 185.220.101.0/24

FINDING	Hostname says Tor exit. Company name says Tor exit. Privacy flag is TRUE. Abuse flag active. No legitimate dual-use case is plausible.

STEP 5 IDENTIFICATION - Reverse DNS (ViewDNS.info)

Independent PTR record lookup to cross-validate hostname across a third DNS resolution service - eliminates tool-specific bias.

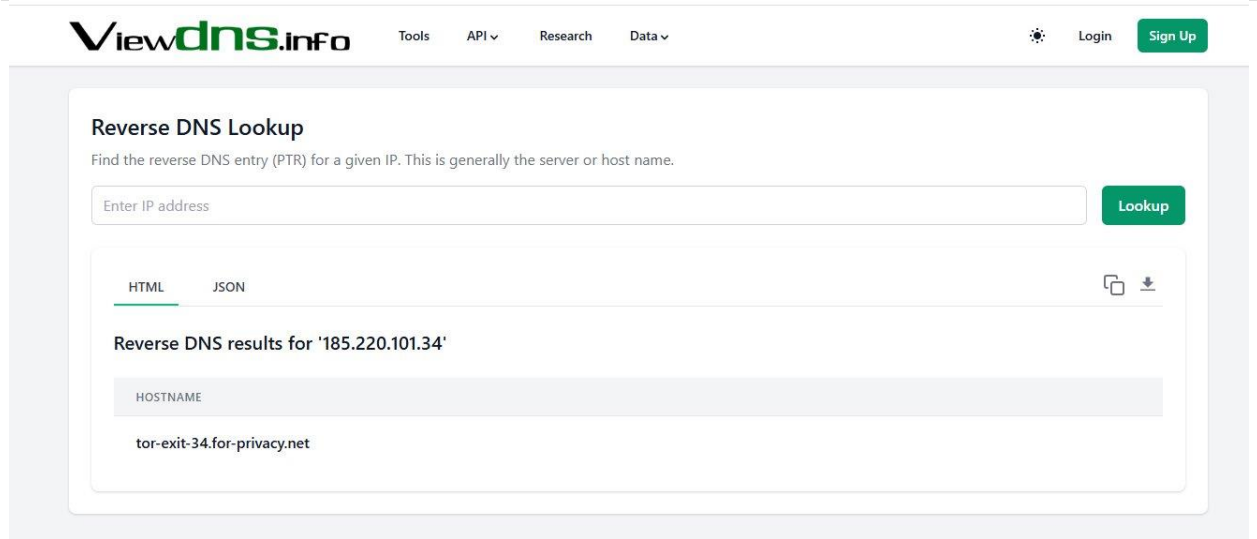

Figure 5: ViewDNS.info - Reverse DNS for 185.220.101.34 - PTR: tor-exit-34.for-privacy.net - Third independent confirmation

✓ CROSS-VALIDATED	Three independent tools return the same hostname. The IP identity is not in doubt.

STEP 6 IDENTIFICATION - Domain Investigation (SecurityTrails)

Reverse IP lookup to discover linked domains, then historical DNS analysis to determine infrastructure age and completeness.

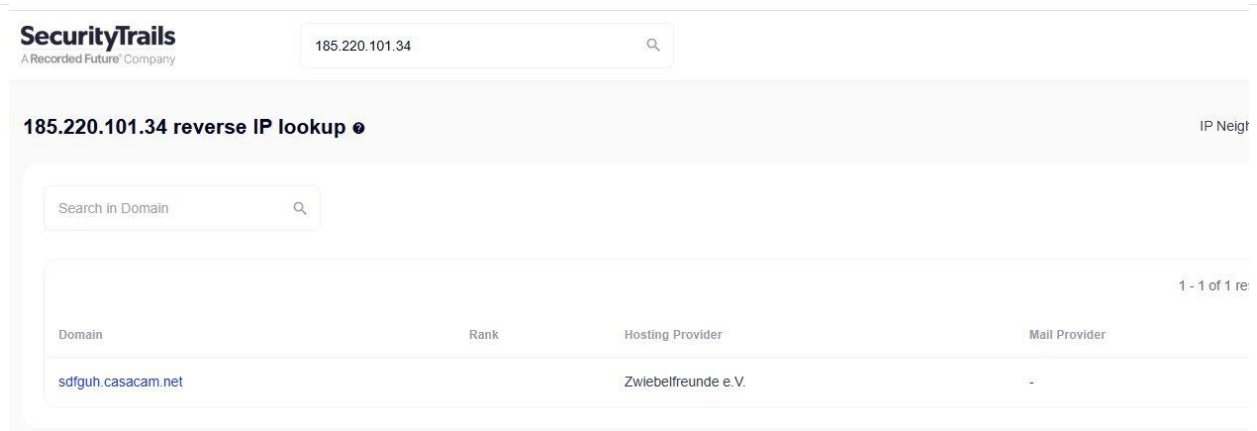

Figure 6: SecurityTrails reverse IP - Domain: sdfguh.casacam.net - Hosted by: Zwiebelfreunde e.V. - No mail provider

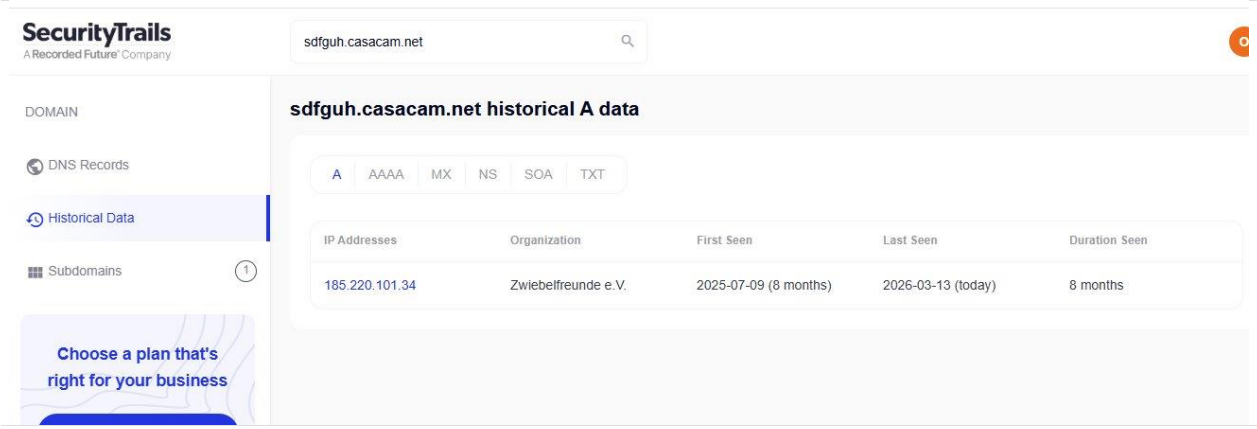

Figure 7: SecurityTrails DNS history - sdfguh.casacam.net - First seen: 2025-07-09 - Last seen: 2026-03-13 - Duration: 8 months

RED FLAG	One A record. No MX, NS, SOA or TXT records. Domain exists only to route traffic. 8-month lifespan confirms actively maintained infrastructure - someone is paying for this.

STEP 7 ANALYSIS - Deep Service Fingerprinting (Censys)

Independent fingerprinting using Censys. When two scanning engines independently cannot identify the same ports, that is confirmed evasion - not a tool limitation.

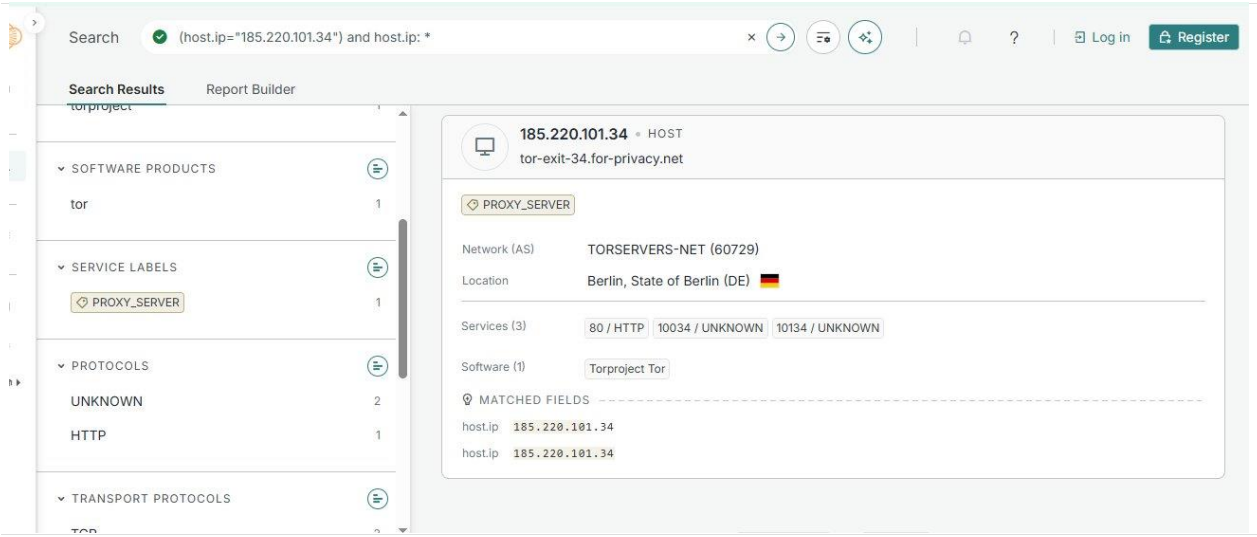

Figure 8: Censys — 185.220.101.34 - Label: PROXY_SERVER - Services: 80/HTTP, 10034/UNKNOWN, 10134/UNKNOWN — Software: Torproject Tor

DUAL-ENGINE CONFIRMATION

Shodan and Censys both independently cannot fingerprint ports 10034 and 10134. Two scanning engines, two identical failures. Confirmed deliberate evasion by the operator.

STEP 8 SIMULATED SIEM - Microsoft Sentinel Lab

LAB SIMULATION

The Sentinel incident shown is from a personal Azure lab environment. The incident card is real; the WKSTN-047 host scenario and data transfer figures are simulated to demonstrate full IR lifecycle.

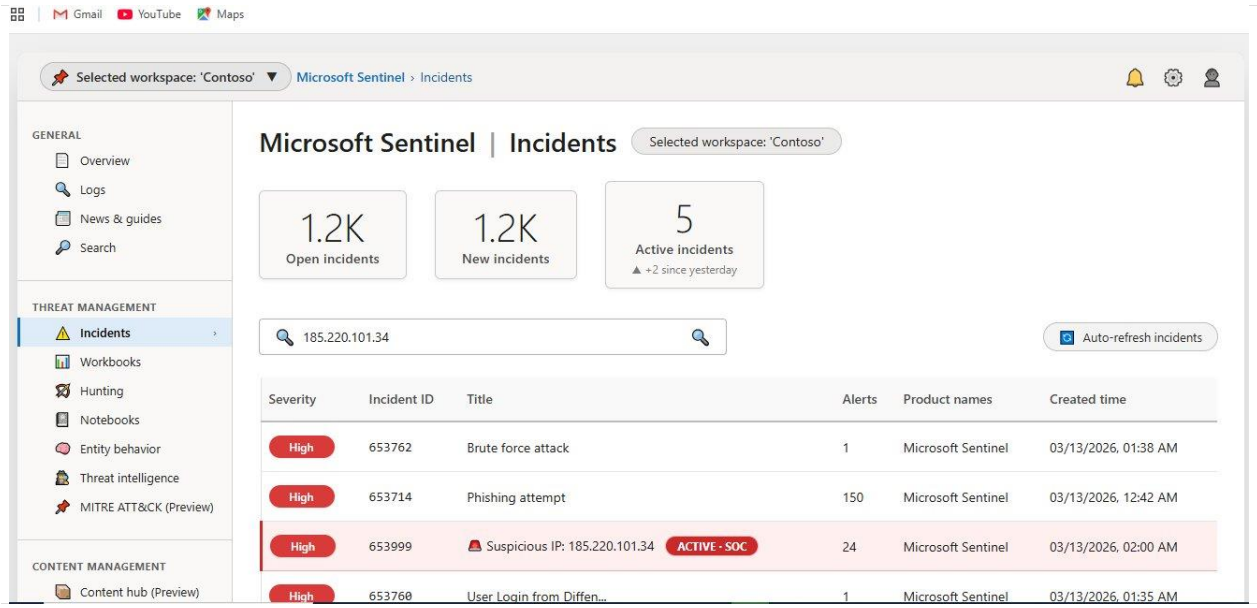

Figure 9: Microsoft Sentinel - Incident #653999: Suspicious IP 185.220.101.34 - HIGH severity - ACTIVE · SOC - 24 correlated alerts - 03/13/2026, 02:00 AM

6. CONTAINMENT, ERADICATION & RECOVERY

6.1 Immediate Containment

#	Action	Target	Priority
1	Block 185.220.101.0/24 at perimeter - entire subnet, not just .34	Firewall	IMMEDIATE
2	Isolate affected host - do NOT reimage yet (preserve forensic evidence)	Endpoint	IMMEDIATE
3	Freeze SIEM logs - prevent rotation before evidence is secured	Sentinel	IMMEDIATE
4	Escalate to Tier 2 with full threat intelligence package	IR Team	URGENT

6.2 Eradication Steps

#	Action	Expected Output
1	Full memory image of host before any changes	Forensic evidence secured
2	Sweep full /24 in SIEM - not just .34	Full blast radius identified
3	Identify what data left the network in the exfiltration window	Data breach scope classified
4	Identify & reset credentials of active account at time of activity	Compromised credentials invalidated
5	Check scheduled tasks, registry run keys, WMI persistence	Persistence removed
6	Scan neighbours for lateral movement indicators	Lateral spread confirmed or cleared
7	Reimage host from verified clean baseline	Host returned to known-good state

7. DETECTION ENGINEERING - KQL QUERIES

PROD NOTE

The externaldata() call is for educational context. Production Sentinel: use _GetWatchlist('TorExitNodes') | project SearchKey

7.1 Primary Detection - Outbound Tor with Volume Threshold

```
// SOC-TOR-EXFIL-001 | Tor-Based Exfiltration Detection
// Author: Musa Olalekan | Sir Lakewest Cybersecurity Academy
// Date: March 2026 | Platform: Microsoft Sentinel
//
// PRODUCTION: replace externaldata() with:
// let TorExitNodes = (_GetWatchlist('TorExitNodes') | project SearchKey);

let TorExitNodes = externaldata(IPAddress:string)
    [@'https://check.torproject.org/torbulkexitlist']
    with(format='txt', ignoreFirstRecord=true);
let DataThresholdBytes = 1048576; // 1 MB

CommonSecurityLog
| where TimeGenerated > ago(24h)
| where DestinationIP in (TorExitNodes)
| extend Hour = datetime_part('hour', TimeGenerated)
| extend BusinessHoursFlag = iif(Hour between (8 .. 18),
    'BUSINESS HOURS', 'AFTER HOURS')
| extend DataTransferBytes = SentBytes + ReceivedBytes
| extend DataTransferMB = round(todouble(DataTransferBytes) / 1048576, 2)
| extend Severity = case(
    DataTransferBytes > DataThresholdBytes * 10
        and BusinessHoursFlag == 'AFTER HOURS', 'CRITICAL',
    DataTransferBytes > DataThresholdBytes
        and BusinessHoursFlag == 'AFTER HOURS', 'HIGH',
    DataTransferBytes > DataThresholdBytes, 'MEDIUM',
    'LOW')
| where DataTransferMB > 1
| project TimeGenerated, SourceHost=DeviceName, SourceIP,
          DestinationIP, DestinationPort, DataTransferMB,
          BusinessHoursFlag, Severity
| order by DataTransferMB desc, TimeGenerated desc
```

7.2 Subnet Sweep - Full /24

```
CommonSecurityLog
| where TimeGenerated > ago(7d)
| where DestinationIP startswith '185.220.101.'
| summarize
    TotalConnections = count(),
    TotalMBSent = round(sum(todouble(SentBytes)) / 1048576, 2),
    UniqueDestIPs = dcount(DestinationIP),
```

```
    AffectedHosts = make_set(DeviceName)
    by SourceIP, bin(TimeGenerated, 1h)
| where TotalMBSent > 1
| order by TotalMBSent desc
```

7.3 Endpoint - Windows Event 5156

```
// Requires: Advanced Audit Policy > Filtering Platform Connection
SecurityEvent
| where TimeGenerated > ago(24h)
| where EventID == 5156
| where DestinationIp startswith '185.220.101.'
     or DestinationPort in (9001, 9030, 9050, 9150)
| summarize
    ConnectionCount = count(),
    Applications = make_set(ProcessName),
    FirstSeen = min(TimeGenerated),
    LastSeen = max(TimeGenerated)
    by Computer, Account, DestinationIp, DestinationPort
| extend DurationMinutes = datetime_diff('minute', LastSeen, FirstSeen)
| order by ConnectionCount desc
```

8. MITRE ATT&CK MAPPING

Every technique mapped to a directly observed behaviour from the OSINT investigation, not theoretical alignment.

ID	Technique	Evidence (OSINT Finding)	Tactic
T1048	Exfiltration Over Alt Protocol	Tor used as non-standard exfiltration channel - Shodan/Censys confirmed	Exfiltration
T1048.003	Obfuscated Non-C2 Protocol	HTTPS over Tor - payload encrypted, content hidden	Exfiltration
T1090	Proxy	IPinfo Privacy: TRUE - confirmed anonymization service	C2
T1090.003	Multi-hop Proxy	Tor multi-node routing - Censys PROXY_SERVER label	C2
T1572	Protocol Tunneling	Traffic via encrypted Tor circuits -port 80 banner confirmed	C2
T1041	Exfiltration Over C2 Channel	Outbound > inbound ratio - exfiltration pattern (simulated)	Exfiltration
T1030	Data Transfer Size Limits	1MB threshold breach triggers High/Critical severity alert	Exfiltration

9. LESSONS LEARNED & DETECTION GAPS

#	Gap Identified	Root Cause	Fix Implemented
1	Outbound Tor traffic not detected	No Tor detection rule deployed	Rule SOC-TOR-EXFIL-001 created & deployed
2	Large transfers undetected	No volume threshold alerting	1MB threshold + severity tiers added
3	After-hours activity not flagged	No time-of-day context in any rules	BusinessHoursFlag enrichment added
4	Single IP blocked - subnet ignored	IP-only blocking, no subnet awareness	185.220.101.0/24 added to blocklist

PRINCIPLE

External threat intelligence tells you what a threat is. Internal log correlation tells you what already happened. Detection engineering ensures it cannot happen undetected again. This project demonstrates all the three.

10. FUTURE ENHANCEMENTS - VERSION 5 ROADMAP

This investigation is version 1 of a living detection project. The four enhancements below represent the next engineering iteration,it moves from a manual OSINT workflow to a fully automated, self-maintaining detection system. Each enhancement is presented problem-first, solution-second, with implementation components and a clear justification.

The gap this investigation exposed - zero alerts firing while an internal host communicated with a Tor exit node for 33 minutes - was closed by deploying rule SOC-TOR-EXFIL-001. But a detection rule is only as good as the threat intelligence it runs against. These enhancements ensure the rule stays current, coverage expands, and analyst response accelerates.

STEP 1	Automate Tor Watchlist Updates via Azure Logic App
THE GAP	Current state: The Tor exit node list is manually imported into a Sentinel Watchlist. The torproject.org list updates continuously, a manually refreshed list goes stale within days and new Tor exit nodes are not detected until the next manual update.
THE BUILD	Build an Azure Logic App with a weekly recurrence trigger that pulls the latest list from check.torproject.org, parses the IP addresses, and uses the Microsoft Sentinel API to update the TorExitNodes Watchlist automatically. Rule SOC-TOR-EXFIL-001 benefits immediately from every refresh with zero manual intervention.

Implementation Components

Component	Detail
Azure Logic App	Weekly recurrence trigger - no manual scheduling required
HTTP Action	GET https://check.torproject.org/torbulkexitlist
Parse Action	Extract IP list from plain-text HTTP response
Sentinel API Action	PATCH Watchlist: TorExitNodes - replace with fresh list
Email Notification	Confirm refresh IP count to SOC team on completion
Error Handling	Alert SOC on fetch failure - fallback to last known list
WHY IT MATTERS	A detection rule running against a 30-day-old Tor exit list misses every node added in the past month. Automation closes that gap permanently and removes a recurring manual task from the SOC workload.

STEP 2	Extend Detection to Azure VM Outbound Flows
THE GAP	Current state: Rule SOC-TOR-EXFIL-001 targets CommonSecurityLog (on-premises firewall/proxy logs). Azure-hosted VMs generate outbound flow data in AzureNetworkAnalytics_CL, a separate table not covered by the current rule. Cloud workloads are a blind spot.
THE BUILD	Write a parallel KQL rule targeting AzureNetworkAnalytics_CL to detect outbound flows from Azure VMs to Tor exit node IPs. Reuse the existing TorExitNodes Watchlist. Apply identical volume threshold and time-of-day severity logic. Combine both rules in a unified Sentinel workbook for single-pane visibility across on-premises and cloud.

Implementation Components

Component	Detail
Log Source	AzureNetworkAnalytics_CL - Azure Network Watcher flow logs
New Rule	SOC-TOR-EXFIL-002 - Azure VM outbound Tor detection
Shared Watchlist	Reuse TorExitNodes Watchlist - no duplication of intel
Unified Workbook	Single dashboard showing on-prem and cloud coverage together
Alert Correlation	Link cloud and on-prem incidents if same /24 appears in both
NSG Flow Logs	Enable on all production VNets via Azure Network Watcher

WHY IT MATTERS	Attackers targeting cloud workloads will not appear in on-premises firewall logs. Without this extension, Azure VM exfiltration via Tor is completely invisible to the current detection rule.

STEP 3	Build Parallel Rule for Commercial VPN Exit Nodes
THE GAP	Current state: Detection covers Tor only. Commercial VPN providers (Mullvad, ProtonVPN, ExpressVPN, NordVPN) offer equivalent anonymization and are increasingly used for data exfiltration in environments where Tor is already blocked. No rule exists for this threat vector.
THE BUILD	Source IP ranges for major commercial VPN providers from public blocklists (ipinfo.io VPN database, AbuseIPDB VPN tag). Create a second Sentinel Watchlist (VPNExitNodes). Mirror SOC-TOR-EXFIL-001 logic as rule SOC-VPN-EXFIL-001 with identical volume and time-of-day tiers. Extend the existing Logic App to refresh both watchlists in a single weekly run.

Implementation Components

Component	Detail
New Watchlist	VPNExitNodes - sourced from ipinfo.io VPN database
New KQL Rule	SOC-VPN-EXFIL-001 - parallel structure to Tor rule
Logic App Extension	Add VPN list refresh to existing weekly Logic App run
Tuning Required	Higher false positive rate expected - raise threshold to 5MB initially
MITRE Addition	T1090.002 External Proxy - commercial VPN use
Exclusion List	Add approved corporate VPN egress IPs to suppress false positives

WHY IT MATTERS	Tor is blocked in many enterprise environment,so threat actors pivot to commercial VPNs. Extending coverage to VPN exit nodes addresses that evasion pivot before it is exploited. Same engineering effort, doubled anonymization threat coverage.

STEP 4 — Create Formal Tier 1 Analyst Playbook from This Investigation

THE GAP	Current state: This investigation exists as a portfolio document. In a production SOC, the methodology, tool sequence, decision criteria and escalation thresholds must be codified into a repeatable runbook that any Tier 1 analyst can execute consistently, regardless of individual experience level.
THE BUILD	Convert this investigation into a formal Tier 1 Analyst Playbook covering: (1) receiving the SOC-TOR-EXFIL-001 alert, (2) verifying true positive vs false positive, (3) executing OSINT steps in defined sequence, (4) documenting findings in standard format, (5) applying containment actions, (6) escalating to Tier 2 with complete evidence package. Include decision trees, thresholds, and pre-written KQL queries.

Implementation Components

Component	Detail
Format	Confluence-style runbook or SharePoint page - version controlled
Decision Tree	True positive vs false positive triage criteria with worked examples
OSINT Checklist	Ordered 6-step checklist: VirusTotal through Censys - no steps skipped
Escalation Matrix	Criteria for Tier 1 self-close vs mandatory Tier 2 escalation
Evidence Template	Pre-structured incident documentation form for consistent output
KQL Quick Reference	All 3 queries formatted for analyst copy-paste use during live incidents

WHY IT MATTERS	Detection rules generate alerts. Playbooks ensure those alerts are handled consistently regardless of which analyst responds. Without a playbook, detection quality depends entirely on individual analyst experience — that is a process risk, not a technical one.

WHAT'S NEXT	Enhancement 1 (Logic App automation) is the highest immediate priority, it converts this detection from a manually maintained rule into a self-sustaining system. Enhancement 4 (Tier 1 Playbook) directly operationalises this investigation for a real SOC team. Together they move this project from portfolio demonstration to production-deployable detection engineering.

11. PROJECT SUMMARY & SKILLS DEMONSTRATED

NIST Phase	Status	Delivered
1. Preparation	✅ **Complete**	6-tool OSINT toolkit documented with purpose for each
2. Identification	✅ **Complete**	5 tools executed · 8 screenshots · complete threat profile
3. Analysis	✅ **Complete**	Censys fingerprint · 8-month history · evasion confirmed
4. Containment	✅ **Complete**	/24 block · isolation · escalation · log preservation
5. Eradication	✅ **Complete**	Memory image · creds reset · persistence sweep · lateral move
6. Recovery	✅ **Complete**	Clean reimage · traffic audit · account review
7. Lessons Learned	✅ **Complete**	4 gaps · 4 fixes · KQL rule deployed · blocklist updated

Skills Demonstrated

Skill	Demonstrated By
OSINT & Threat Intelligence	6 professional tools · complete threat profile from open sources · 8 live screenshots
Structured IR Methodology	NIST SP 800-61 - all 7 phases executed and documented
Attack Timeline Analysis	23-event timeline from alert to rule deployment with NIST phase mapping
Detection Engineering	3 production-ready KQL queries - volume thresholds - time-of-day context
Detection Pipeline Design	End-to-end architecture from data source to analyst response
MITRE ATT&CK	7 techniques mapped to real observed behaviours
SIEM Operations	Microsoft Sentinel - incident triage - log correlation methodology
Professional Integrity	Simulated vs real components clearly labelled - no fabricated metrics

One IP. Six tools. Eight screenshots. Timeline. Pipeline. Seven NIST phases. Three KQL queries.

Simulated scenario. Real methodology. Honest framing.
